

First 13 TeV search for new heavy spin-0 resonances decaying into top quarks at CMS

A. Anuar, K. Beernaert, A. Grohsjean,
C. Schwanenberger, N. Stefanov, G. Van Onsem

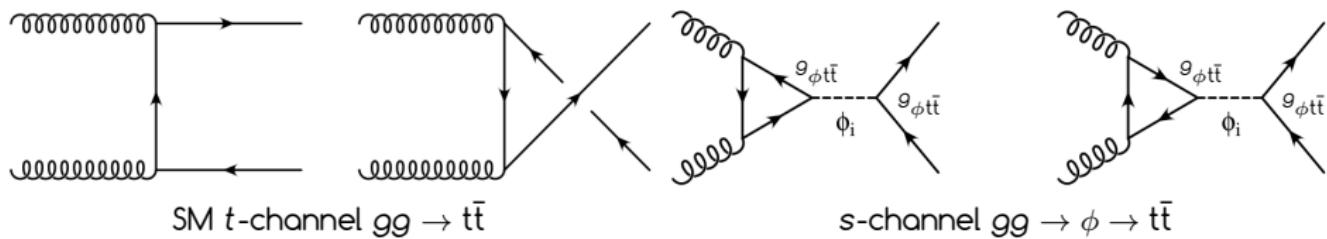

28 March 2017

Introduction

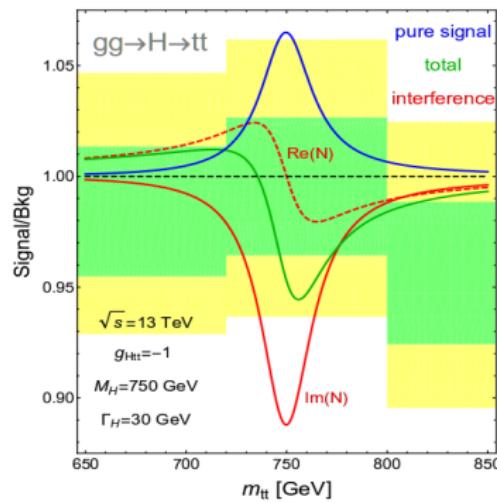

- Search for resonant ϕ decaying to $t\bar{t}$

- Consider both pseudoscalar A and scalar H
- A is of particular interest as $BR(A \rightarrow t\bar{t}) \sim 1$; $A \rightarrow VV$ forbidden by CP conservation
- Interference with SM taken into account for the first time in CMS
- Coupling between ϕ and top quark denoted with the letter $g_{\phi t\bar{t}}$

Introduction

- Search for resonant ϕ decaying to $t\bar{t}$
 - Consider both pseudoscalar A and scalar H
 - A is of particular interest as $\text{BR}(A \rightarrow t\bar{t}) \sim 1$; $A \rightarrow VV$ forbidden by CP conservation
 - Interference with SM taken into account for the first time in CMS
 - Coupling between ϕ and top quark denoted with the letter $g_{\phi t\bar{t}}$
- Significant peak-dip structure in $m_{t\bar{t}}$ spectrum due to interference
 - No resonance peak in some cases
 - Exact structure depends on parity, m_ϕ and Γ_ϕ

Plot from arXiv:1605.00542

Analysis strategy

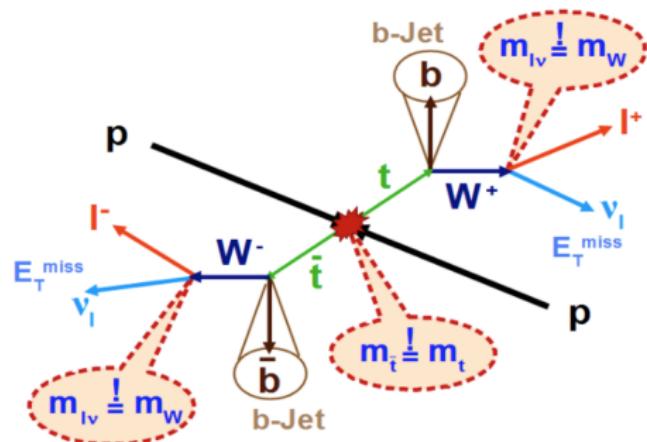

- Search performed over 2016 CMS data totalling 35.7 fb^{-1}
- Focus on the **dileptonic** channel
 - Both W bosons in top decays decay leptonically, with $\ell = e$ or μ
 - Complimentary semileptonic search not covered here
- Generated signal points:
 - $2D [m_\phi, \Gamma_\phi]$ array in $(400, 500, 600, 750) \text{ GeV}$ and $(2.5\%, 5\%, 10\%, 25\%, 50\%) m_\phi$
 - $g_{\phi t\bar{t}}$ assumed to be 1
- Set limits on $g_{\phi t\bar{t}}^2$ through shape analysis on $m_{t\bar{t}}$ spectrum
- Increased sensitivity by exploiting other observables on top of $m_{t\bar{t}}$

Event selection

- 2 opposite-sign isolated leptons: $\rho_T > 25, 20 \text{ GeV}$, $|\eta| < 2.4$
 - $m_{\ell\ell} > 20 \text{ GeV}$ and $\Delta R > 0.4$ from all jets
 - In same-flavor channels: $|m_{\ell\ell} - m_Z| > 15 \text{ GeV}$ and $\cancel{E}_T > 40 \text{ GeV}$
 - Events with additional leptons are vetoed
- 2 leading (additional) jets: $\rho_T > 30 (20) \text{ GeV}$, $|\eta| < 2.4$
 - At least one is b-tagged
- Corrections to account for data-simulation differences
 - Object-based scale factors
 - Pile-up reweighting

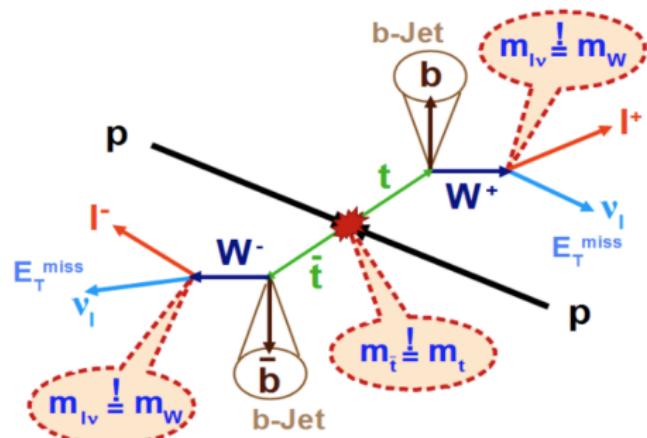

$t\bar{t}$ kinematic reconstruction

- Missing neutrinos in the event $\rightarrow t\bar{t}$ system is underconstrained

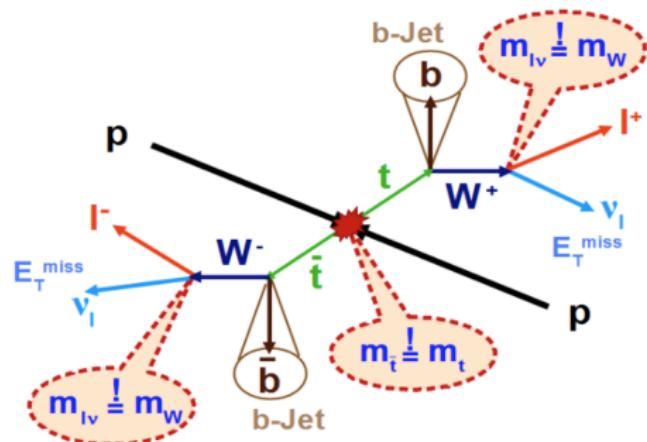

$t\bar{t}$ kinematic reconstruction

- Missing neutrinos in the event $\rightarrow t\bar{t}$ system is underconstrained
- Reconstruct the $t\bar{t}$ system with an analytical routine
(arXiv:hep-ph/0603011)

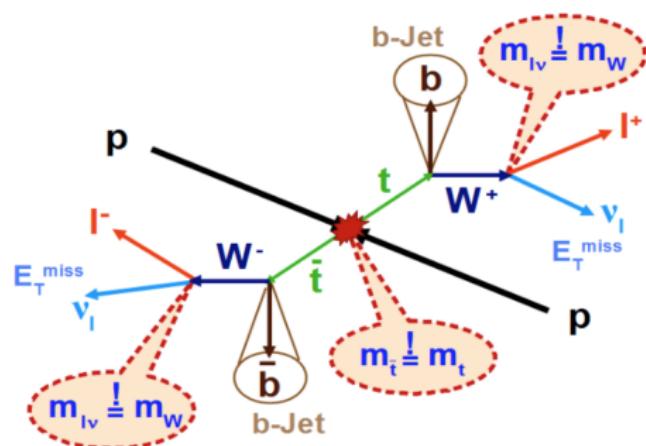

$t\bar{t}$ kinematic reconstruction

- Missing neutrinos in the event $\rightarrow t\bar{t}$ system is underconstrained
- Reconstruct the $t\bar{t}$ system with an analytical routine
(arXiv:hep-ph/0603011)
 - Impose constraints based on known top and W masses
 - Assume E_T is entirely due to the neutrinos
 - Resulting polynomial in p_i^ν solvable leading to full $t\bar{t}$ system kinematics

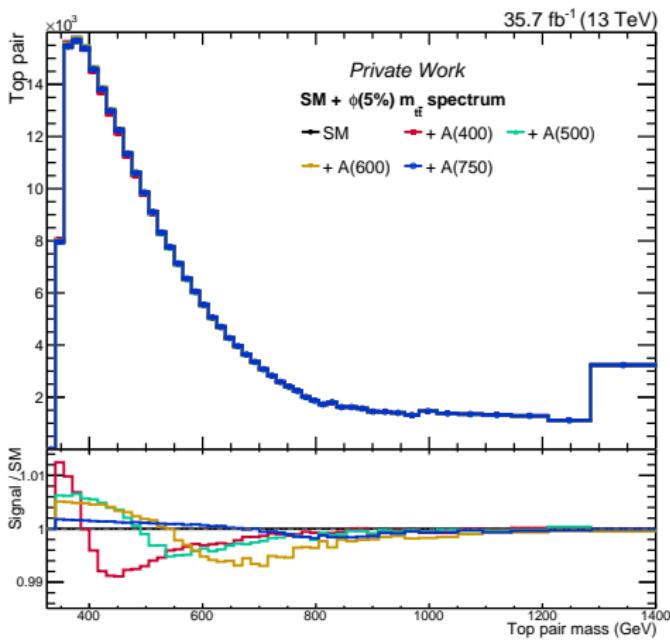

$t\bar{t}$ kinematic reconstruction

- Missing neutrinos in the event $\rightarrow t\bar{t}$ system is underconstrained
- Reconstruct the $t\bar{t}$ system with an analytical routine
(arXiv:hep-ph/0603011)
 - Impose constraints based on known top and W masses
 - Assume E_T is entirely due to the neutrinos
 - Resulting polynomial in p_i^ν solvable leading to full $t\bar{t}$ system kinematics
- Increase efficiency by solving for all lepton-jet combinations
- Account for detector effects by random object smearings
- Procedure described in detail in CMS-PAS-TOP-16-011

Systematic effects on $m_{t\bar{t}}$

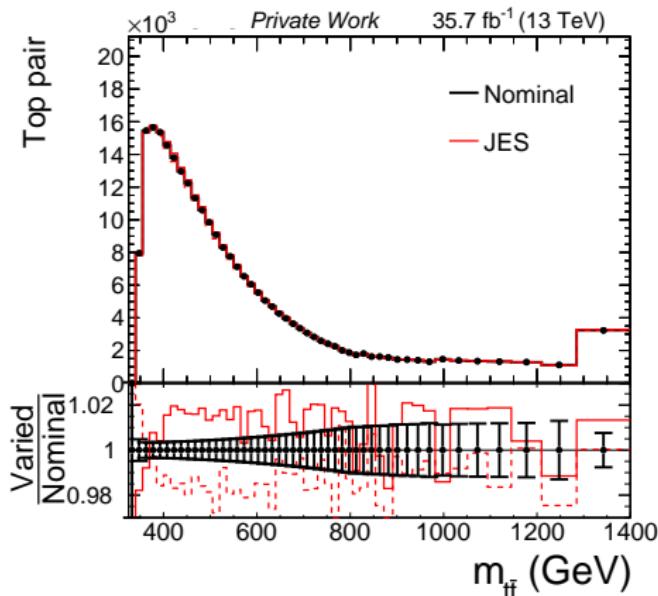

- Crucial to evaluate systematics affecting $m_{t\bar{t}}$ shape

$m_{t\bar{t}}$ distribution obtained with the kinematic reconstruction routine

Systematic effects on $m_{t\bar{t}}$

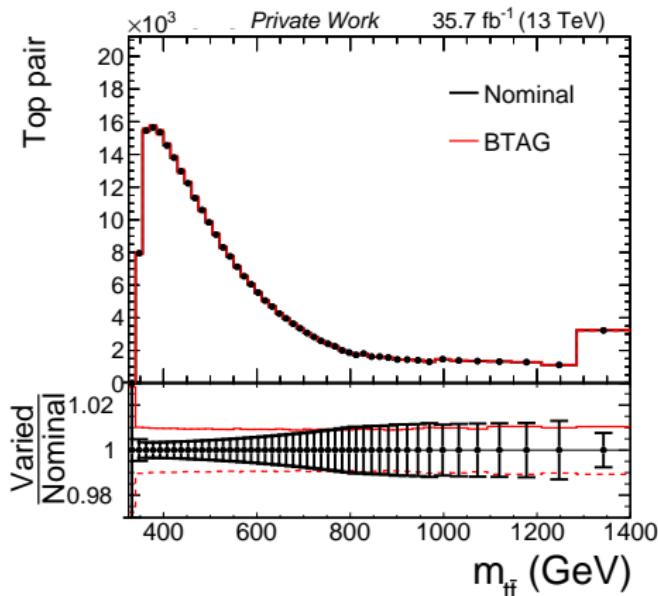

- Crucial to evaluate systematics affecting $m_{t\bar{t}}$ shape
- Partial list of considered systematic sources:
 - Jet energy scale

Solid: up variation; dashed: down variation

Systematic effects on $m_{t\bar{t}}$

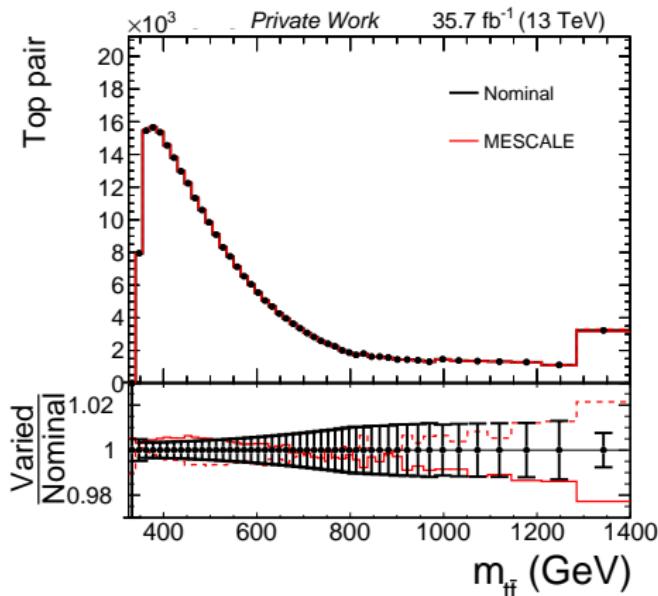

- Crucial to evaluate systematics affecting $m_{t\bar{t}}$ shape
- Partial list of considered systematic sources:
 - Jet energy scale
 - b-tag

Solid: up variation; dashed: down variation

Systematic effects on $m_{t\bar{t}}$

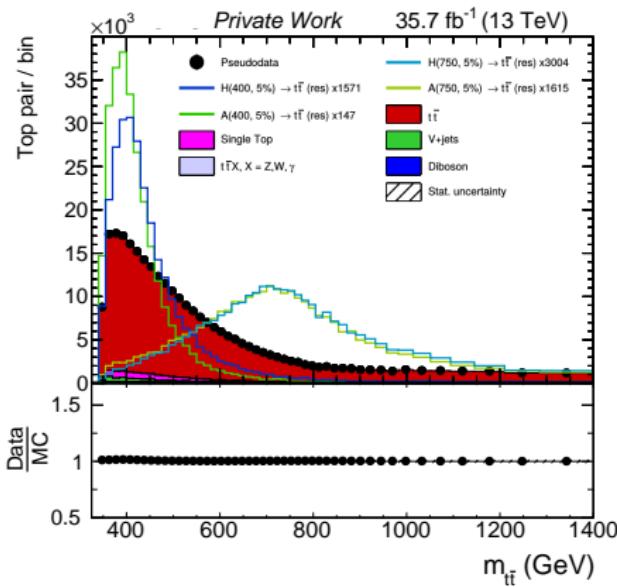

- Crucial to evaluate systematics affecting $m_{t\bar{t}}$ shape
- Partial list of considered systematic sources:
 - Jet energy scale
 - b-tag
 - ME fact. & ren. scale

Solid: up variation; dashed: down variation

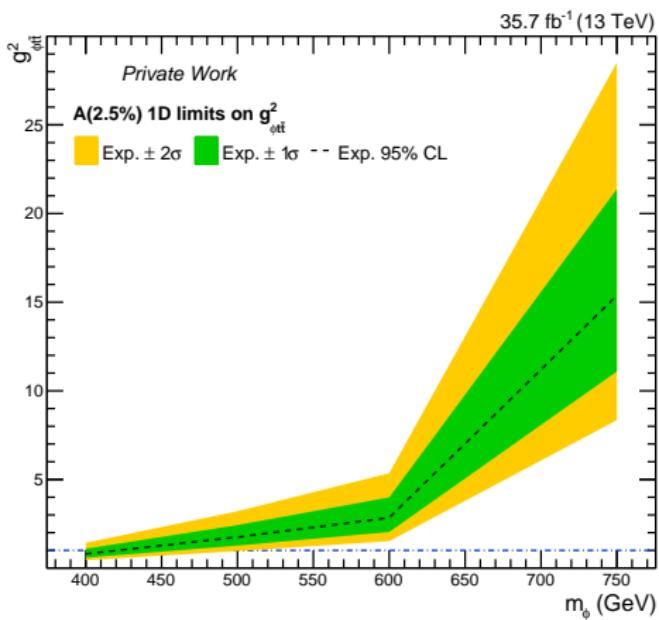

Limits with $m_{t\bar{t}}$

- Limits evaluated with $m_{t\bar{t}}$ templates
- MC-estimated background processes:
 - $t\bar{t}$ (+ V)
 - Single top
 - V + jets
 - Diboson
- DY yield estimated from data

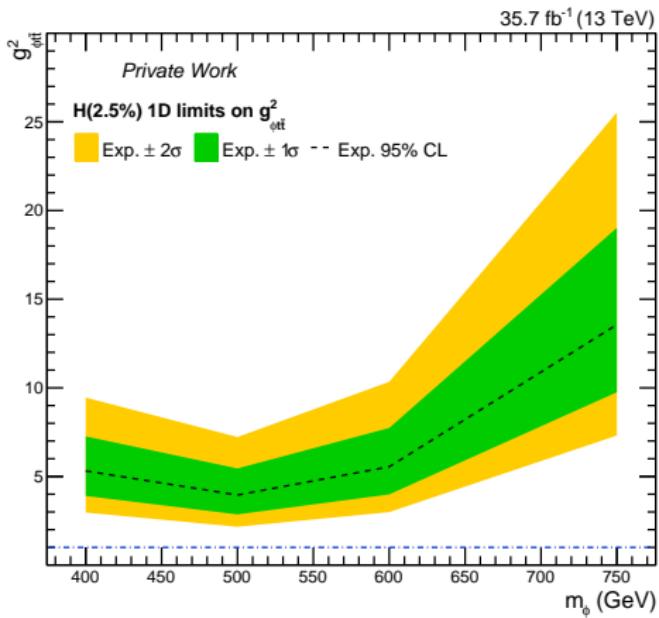

Limits with $m_{t\bar{t}}$

- Limits evaluated with $m_{t\bar{t}}$ templates
- MC-estimated background processes:
 - $t\bar{t}$ (+ V)
 - Single top
 - V + jets
 - Diboson
- DY yield estimated from data
- Limits on $A(2.5\%)$ on the right

Limits with $m_{t\bar{t}}$

- Limits evaluated with $m_{t\bar{t}}$ templates
- MC-estimated background processes:
 - $t\bar{t}$ (+ V)
 - Single top
 - V + jets
 - Diboson
- DY yield estimated from data
- Limits on $H(2.5\%)$ on the right

Spin correlation variables

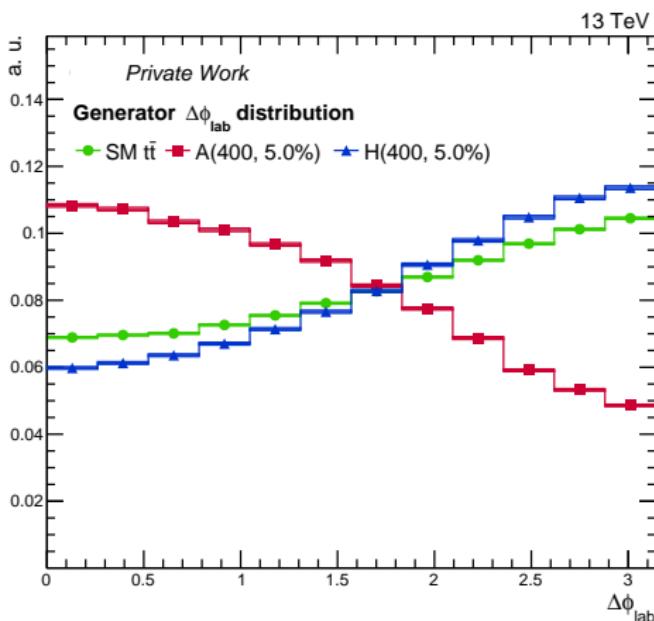

- Top quark spin information is inherited by the charged leptons
- Exploit this fact to probe the spin of the $t\bar{t}$ mother
 - Different ϕ and gluon templates
 - Also sensitive to A vs H

Spin correlation variables

- Top quark spin information is inherited by the charged leptons
- Exploit this fact to probe the spin of the $t\bar{t}$ mother
 - Different ϕ and gluon templates
 - Also sensitive to A vs H
- Identified 2 observables with highest sensitivity

Spin correlation variables

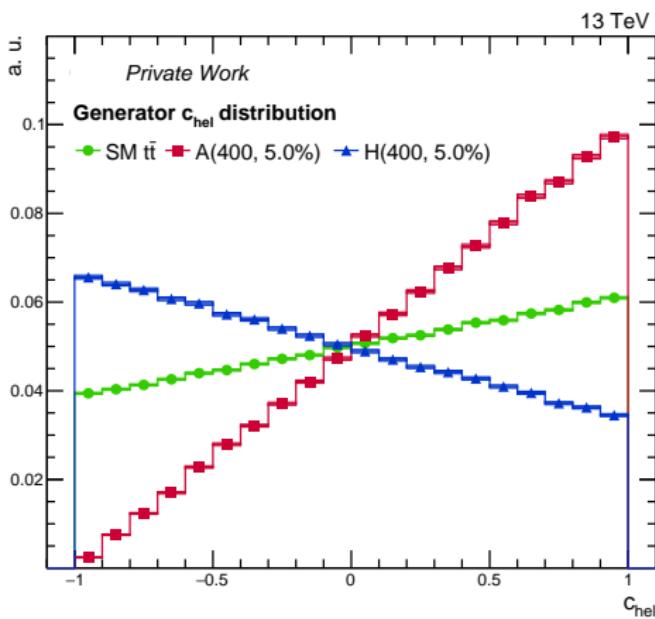

- Top quark spin information is inherited by the charged leptons
- Exploit this fact to probe the spin of the $t\bar{t}$ mother
 - Different ϕ and gluon templates
 - Also sensitive to A vs H
- Identified 2 observables with highest sensitivity
 - $\Delta\phi_{lab}$

Distributions are normalized to unit area and resonance-only for A/H

Spin correlation variables

- Top quark spin information is inherited by the charged leptons
- Exploit this fact to probe the spin of the $t\bar{t}$ mother
 - Different ϕ and gluon templates
 - Also sensitive to A vs H
- Identified 2 observables with highest sensitivity
 - $\Delta\phi_{lab}$
 - c_{hel}

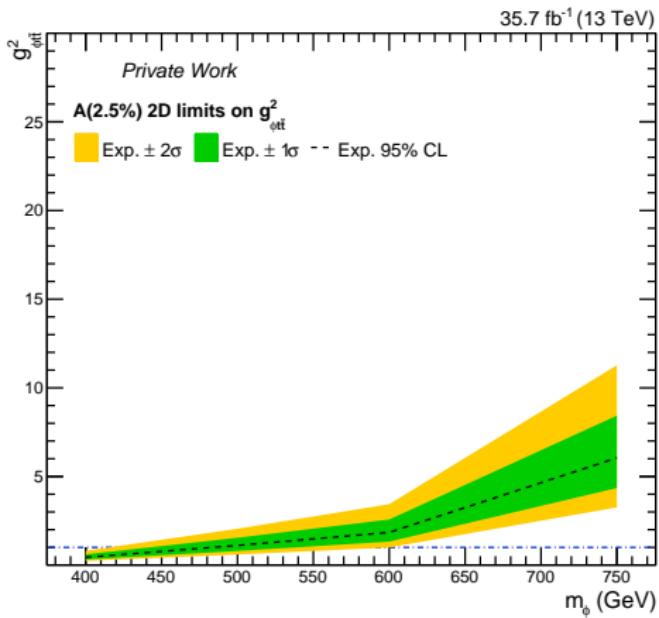

Distributions are normalized to unit area and resonance-only for A/H

2D limits

- Set limits with the 2D template of
 $m_{t\bar{t}}$ vs c_{hel}

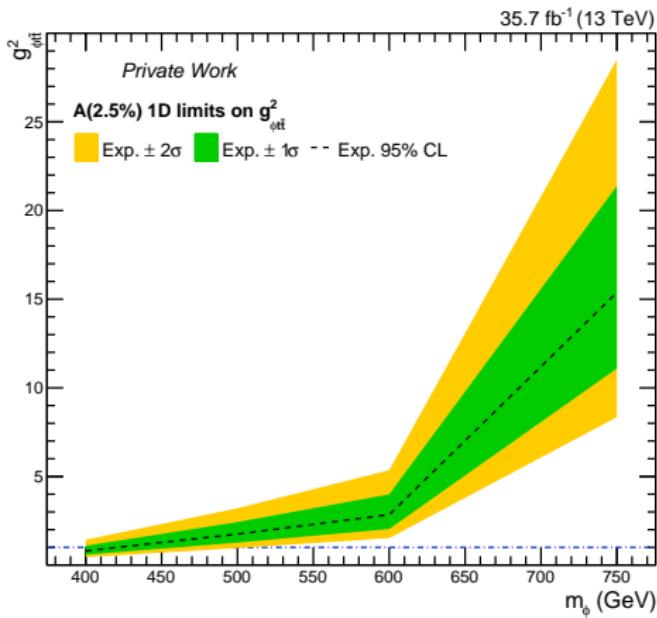

2D limits

- Set limits with the 2D template of $m_{t\bar{t}}$ vs C_{hel}
- Limits on $A(2.5\%)$ on the right

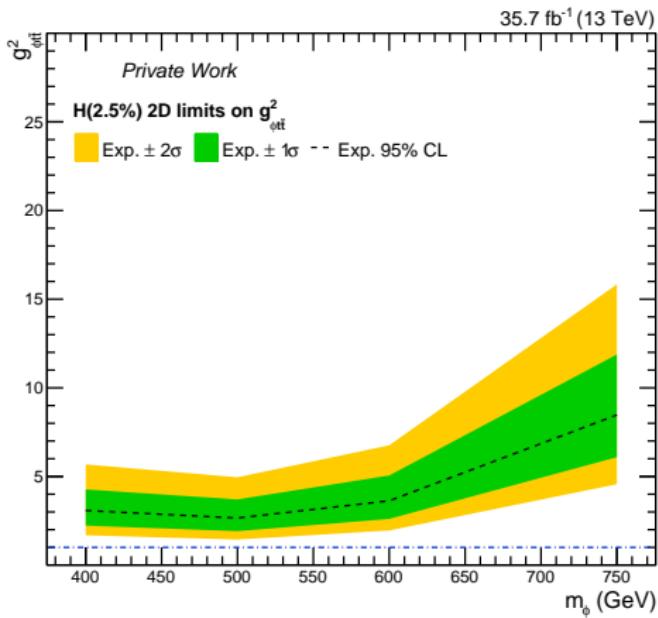

2D limits

- Set limits with the 2D template of $m_{t\bar{t}}$ vs C_{hel}
- Limits on $A(2.5\%)$ on the right
- Significant improvement vs $m_{t\bar{t}}$ -only limits

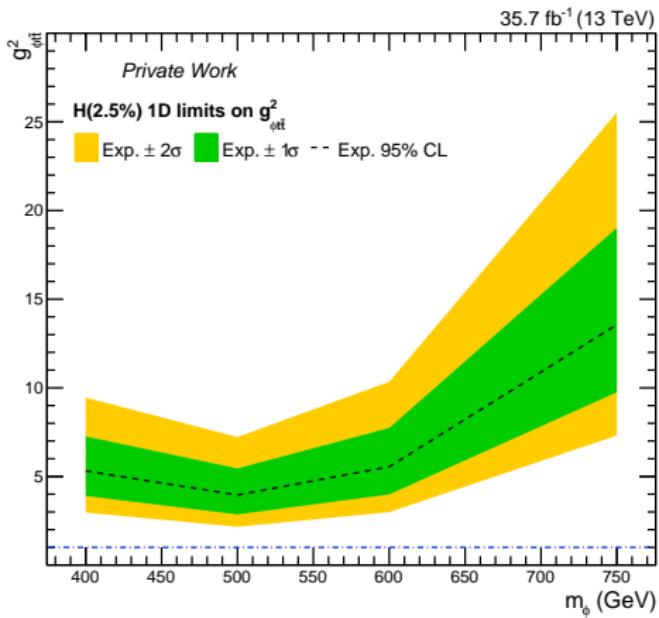

2D limits

- Set limits with the 2D template of $m_{t\bar{t}}$ vs C_{hel}
- Significant improvement vs $m_{t\bar{t}}$ -only limits
- Similar effect seen for H(2.5%)

2D limits

- Set limits with the 2D template of $m_{t\bar{t}}$ vs C_{hel}
- Significant improvement vs $m_{t\bar{t}}$ -only limits
- Similar effect seen for H(2.5%)

Summary

- An overview of the search for resonant spin-0 ϕ production decaying to $t\bar{t}$ has been presented
- Emphasis on the increased sensitivity by exploiting spin correlation observables on top of the $m_{t\bar{t}}$ spectrum

Summary

- An overview of the search for resonant spin-0 ϕ production decaying to $t\bar{t}$ has been presented
- Emphasis on the increased sensitivity by exploiting spin correlation observables on top of the $m_{t\bar{t}}$ spectrum
