Searches for Exotic Higgs Bosons at ATLAS and CMS

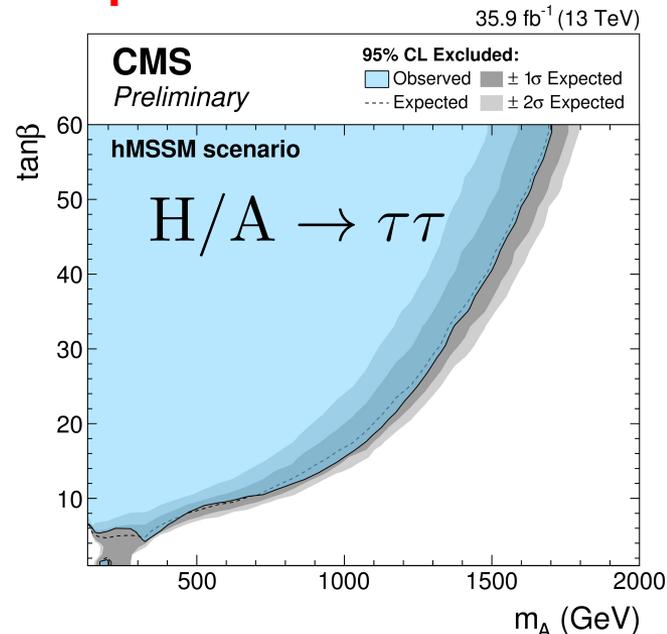

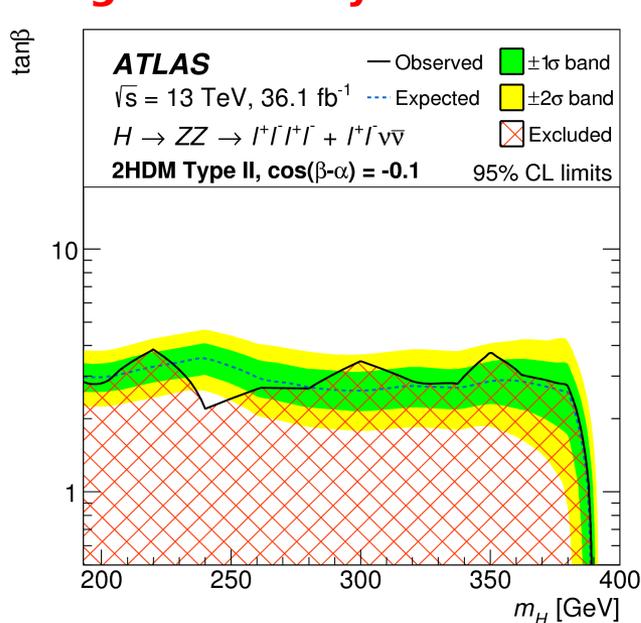

Alexei Raspereza

DESY - Hamburg

*53rd Recontres de Moriond - QCD and High
Energy Interactions, 17 - 24 March 2018*

Introduction

- Recent Higgs studies confirm that Electroweak Symmetry Breaking is realized via Brout-Englert-Higgs mechanism
- What is the structure of the Higgs potential? Two ways to address this question
 - high precision measurement of the discovered Higgs boson
 - search for additional Higgs bosons predicted by theories beyond SM (BSM)
- Main focus of BSM Higgs searches at LHC : general two Higgs doublet models (2HDM) and minimal supersymmetric standard model (MSSM)
 - no signal found yet → limits on model parameters are set

- This talk → searches for exotic Higgs bosons beyond 2HDM and MSSM

2 Higgs Doublets + 1 Singlet Models

7 physical Higgs states : 2 CP-odd $a_{1,2}$, 3 CP-even $h_{1,2,3}$, 2 charged h^\pm

example : next-to-MSSM

Higgs sector : 2HD+1S type-2

solves μ -problem of MSSM

$$\lambda \hat{S} \hat{H}_u \hat{H}_d \rightarrow \mu_{\text{eff}} = \lambda \langle S \rangle$$

	Type-1	Type-2	Type-3 (lepton-specific)	Type-4 (flipped)
Up-type quarks	Φ_2	Φ_2	Φ_2	Φ_2
Down-type quarks	Φ_2	Φ_1	Φ_2	Φ_1
Charged leptons	Φ_2	Φ_1	Φ_1	Φ_2
a_1 couplings to fermions				
Up-type quarks	$\cot \beta$	$\cot \beta$	$\cot \beta$	$\cot \beta$
Down-type quarks	$-\cot \beta$	$\tan \beta$	$-\cot \beta$	$\tan \beta$
Charged leptons	$-\cot \beta$	$\tan \beta$	$\tan \beta$	$-\cot \beta$

$$\tan \beta = v_{\Phi_2} / v_{\Phi_1}$$

Particular scenario

a_1 is very light ($2m_{a_1} < m_{H(125)}$) and has large singlet component

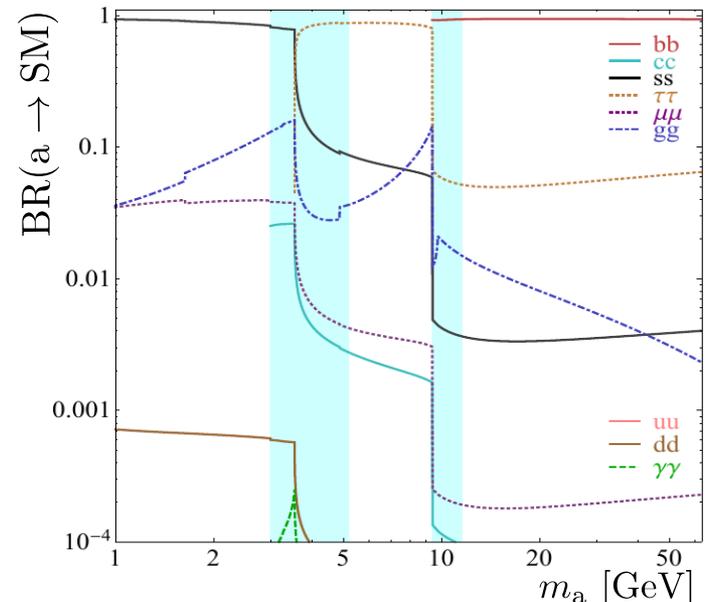

→ reduced couplings to fermions

• hard to detect via conventional production mechanisms

$$gg \rightarrow a_1 \text{ \& \ } bba_1$$

• accessible via $H(125) \rightarrow a_1 a_1 \rightarrow (f_1 \bar{f}_1)(f_2 \bar{f}_2)$

$\tan \beta = 5$, TYPE II

CMS H(125) \rightarrow aa \rightarrow ($\tau\tau$)(bb) Search at 13 TeV

HIG-17-024

35.9 fb⁻¹ (13 TeV)

- analyzed di-tau signatures : $\tau_e\tau_\mu, \tau_e\tau_h, \tau_\mu\tau_h$
- at least one b-tagged jet : $p_T > 15$ GeV, $|\eta| < 2.4$

in large fraction of signal events second b-jet is too soft

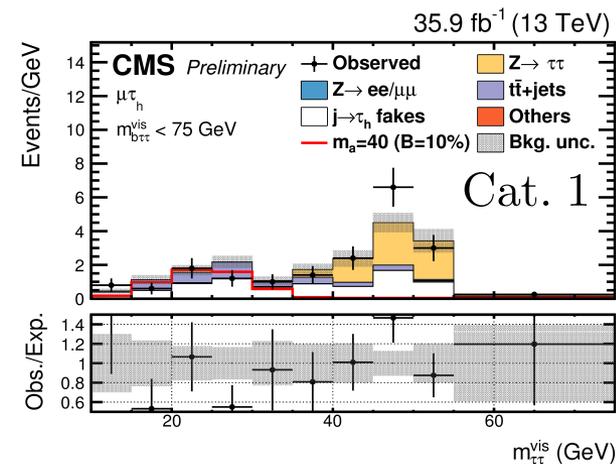

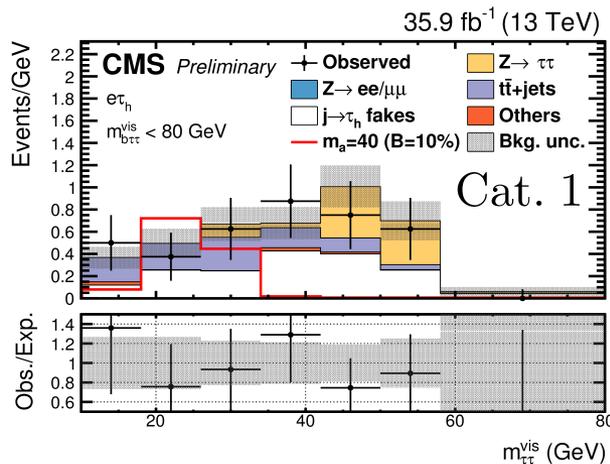

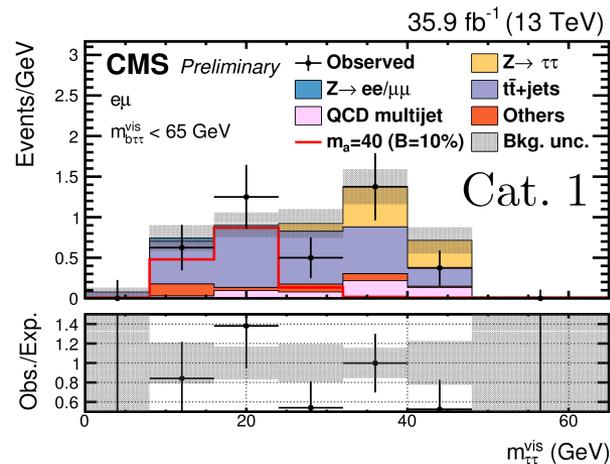

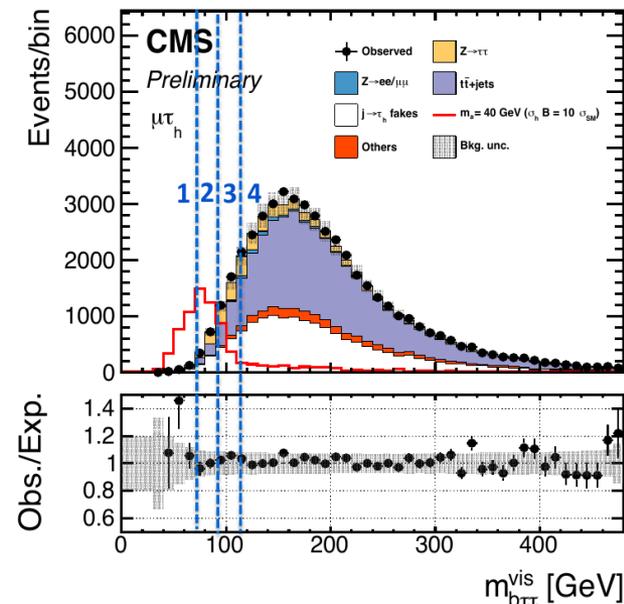

- event categorization based on mass of selected τ candidates and b-jet

low $m_{b\tau\tau}^{\text{vis}}$ categories have little background

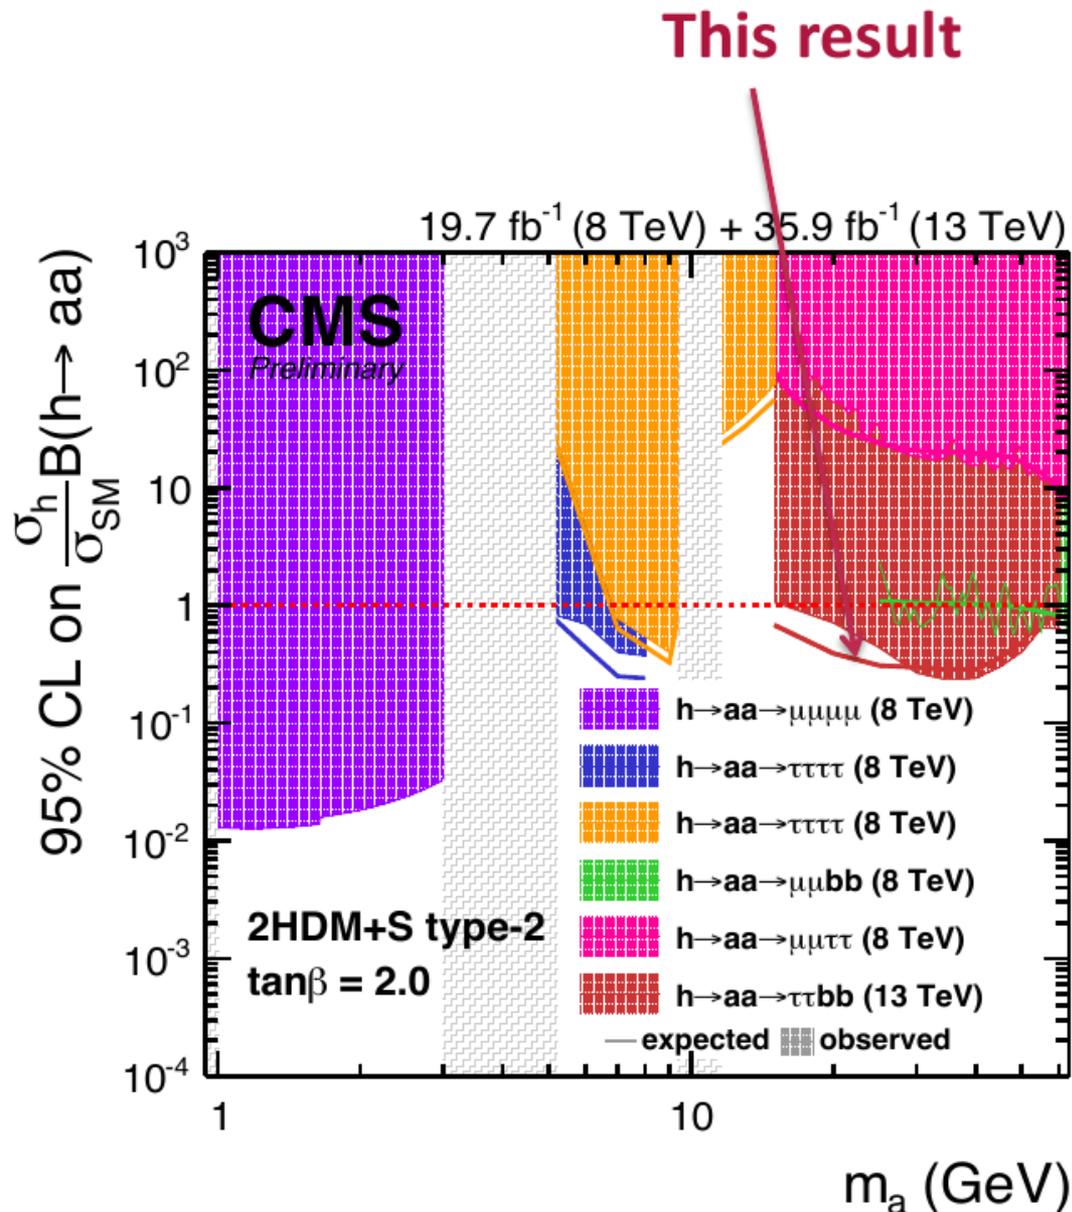

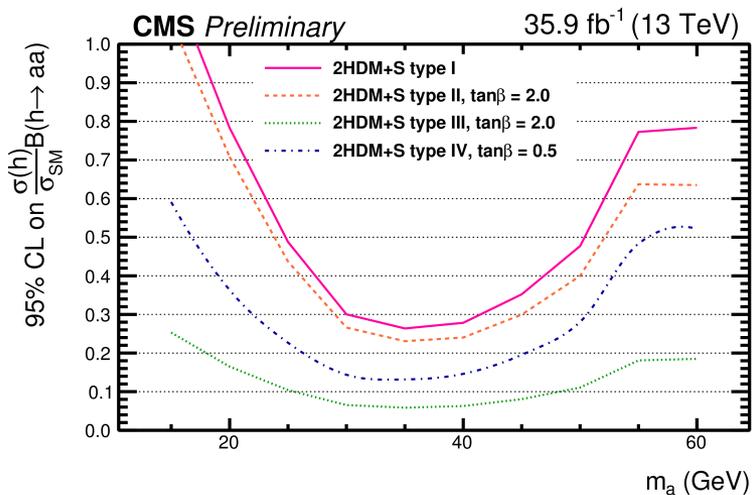

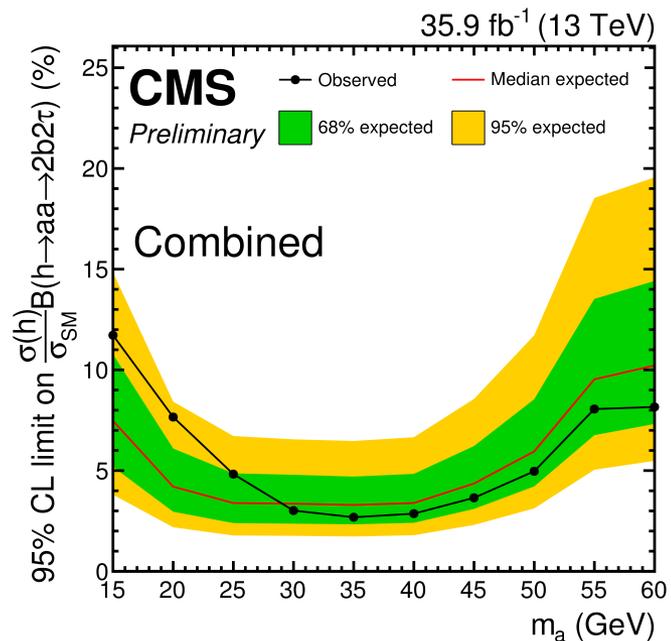

\rightarrow enhanced sensitivity

highest $m_{b\tau\tau}^{\text{vis}}$ category : background control regions

- signal is extracted from simultaneous fit to $m_{\tau\tau}^{\text{vis}}$ in all channels and all event categories

Interpretations of $H(125) \rightarrow aa \rightarrow (\tau\tau)(bb)$ Search

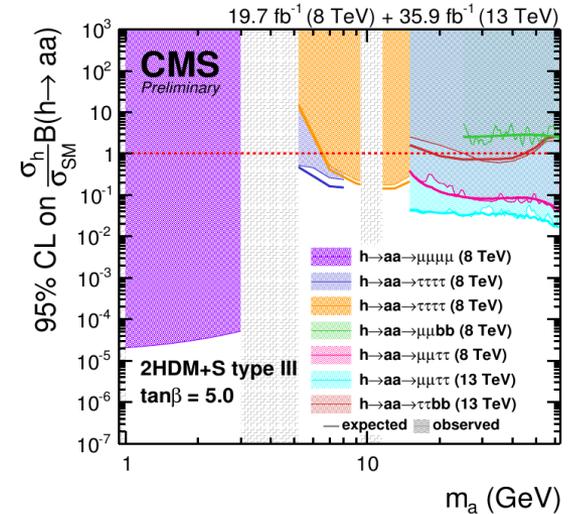

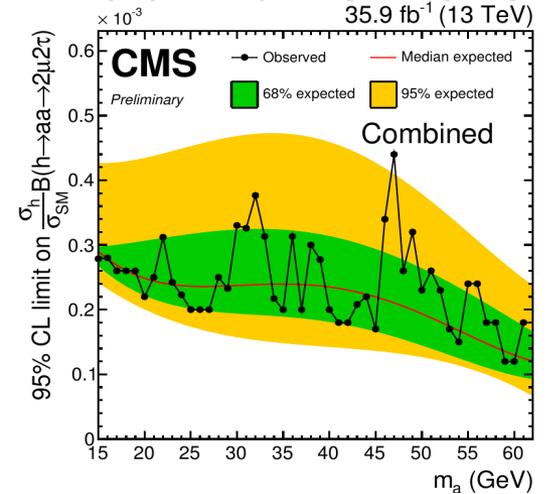

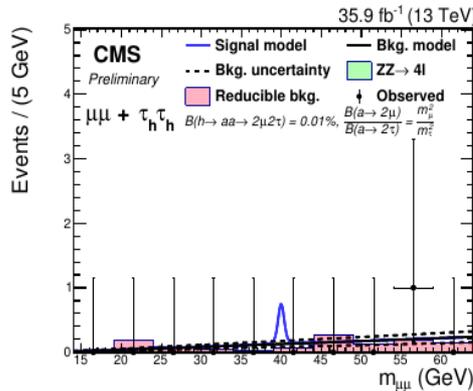

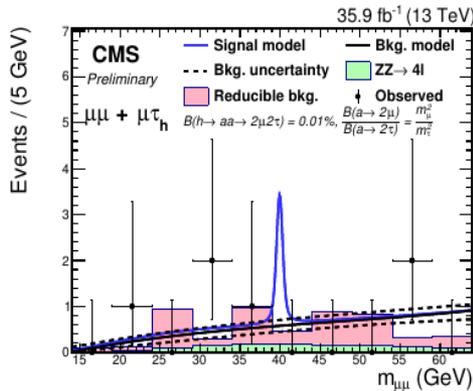

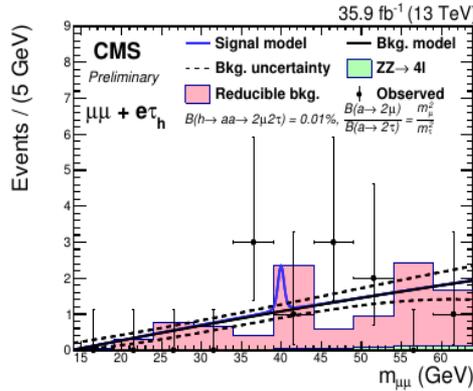

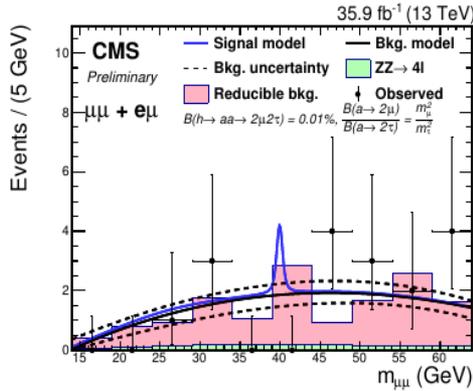

H(125) \rightarrow aa \rightarrow ($\mu\mu$)($\tau\tau$) Search with CMS at 13 TeV

HIG-17-029

- analyzed final states : $\mu\mu + \tau_e\tau_\mu$, $\mu\mu + \tau_e\tau_h$, $\mu\mu + \tau_\mu\tau_h$, $\mu\mu + \tau_h\tau_h$
- probed m_a range : 15 - 62.5 GeV

$m_a \geq 15$ GeV : sizable angular separation between leptons in a \rightarrow $\mu\mu$ ($\tau\tau$) decays
 \rightarrow selection of isolated leptons

- signal extracted from fit to $m_{\mu\mu}$ of a \rightarrow $\mu\mu$ candidate

No significant access in any channel

ATLAS H(125) \rightarrow aa \rightarrow 4 μ Search at 13 TeV

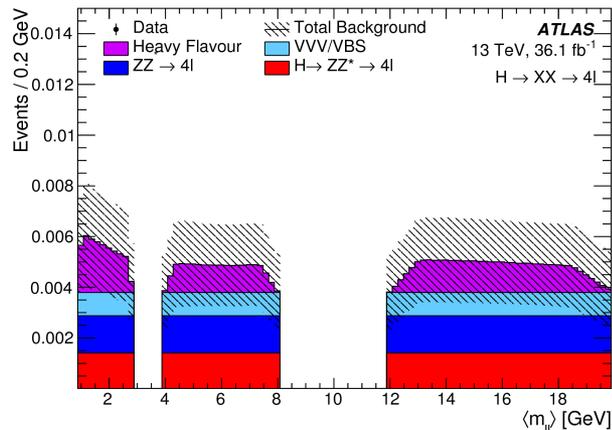

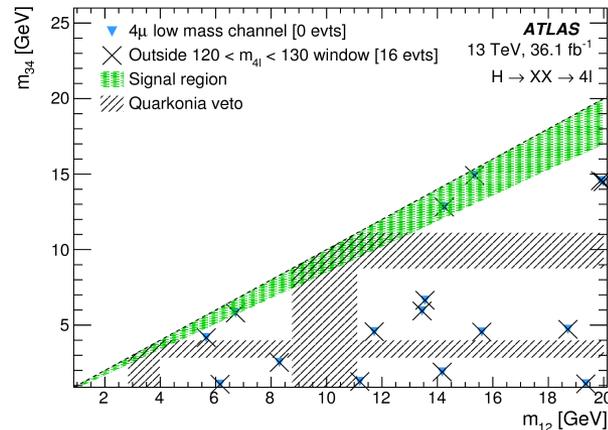

arXiv:1802.03388

• **selection of $(\mu^+\mu^-)(\mu^+\mu^-)$ events :**

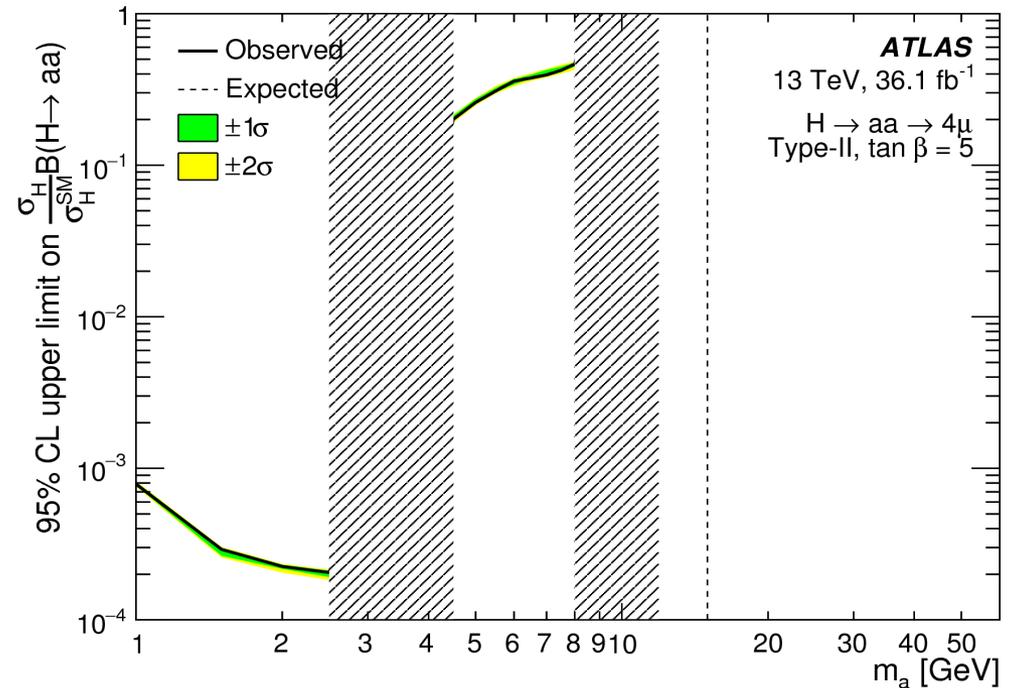

$$0.88 < m_{12,34} < 20 \text{ GeV}, \quad 120 < m_{4\mu} < 130 \text{ GeV}$$

$$m_{34}/m_{12} > 0.85$$

$m_{12,34}$ - **invariant masses of $\mu^+\mu^-$ pairs, $m_{12} > m_{34}$**

probed m_a range : 1 - 15 GeV

Phenomenology of Models with $H^{\pm\pm}$

- $H^{\pm\pm}$ appear in Higgs triplet models attempting to explain neutrino mass hierarchy
 - **type-II see-saw models**
 - **left-right symmetric (LRS) models**
- **distinguish between $H_L^{\pm\pm}$ and $H_R^{\pm\pm}$ (couple to ℓ_L and ℓ_R , respectively)**
- **$H_L^{\pm\pm}$ and $H_R^{\pm\pm}$ have different couplings to Z boson**

- **experimental signatures**

$$q\bar{q} \rightarrow Z/\gamma^* \rightarrow H^{++}H^{--}$$

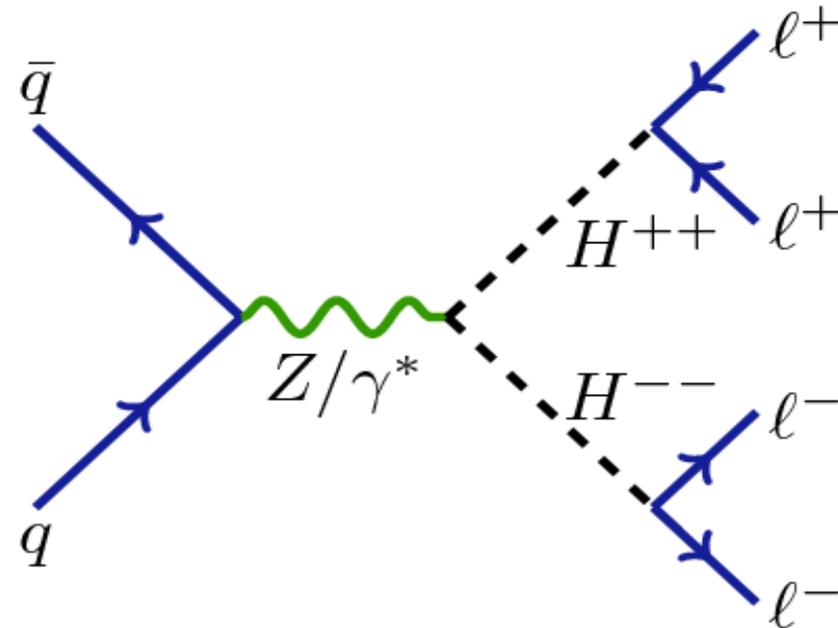

$$H^{\pm\pm} \rightarrow W^{\pm}W^{\pm} \text{ or } H^{\pm\pm} \rightarrow \ell_i^{\pm}\ell_j^{\pm}$$

- **for many models mass-coupling relation doesn't hold for $H^{\pm\pm}$**

→ **no preference for decays to $\tau^{\pm}\tau^{\pm}$**

→ **high sensitivity is provided by decays into lighter leptons**

$$H^{\pm\pm} \rightarrow e^{\pm}e^{\pm}, \mu^{\pm}\mu^{\pm}, e^{\pm}\mu^{\pm}$$

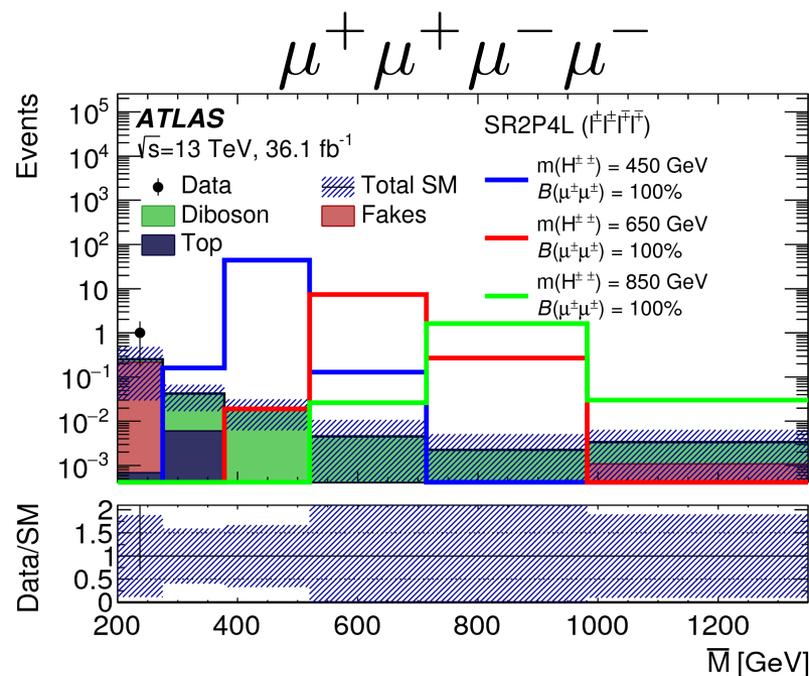

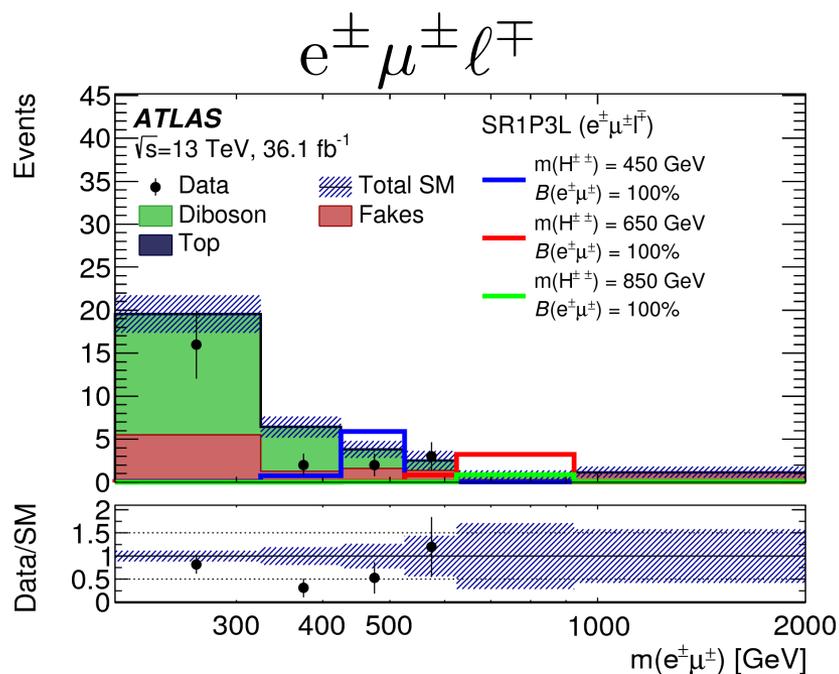

ATLAS Search for $H^{\pm\pm}$ at 13 TeV

arXiv:1710.09748

- Analysis searches for $H^{\pm\pm}$ in multi-lepton final states from $H^{++}H^{-}$ production
- Events classified in various categories based on
 - **lepton multiplicity and lepton flavor composition**
- Signal is extracted from simultaneous fit to mass variables in all categories

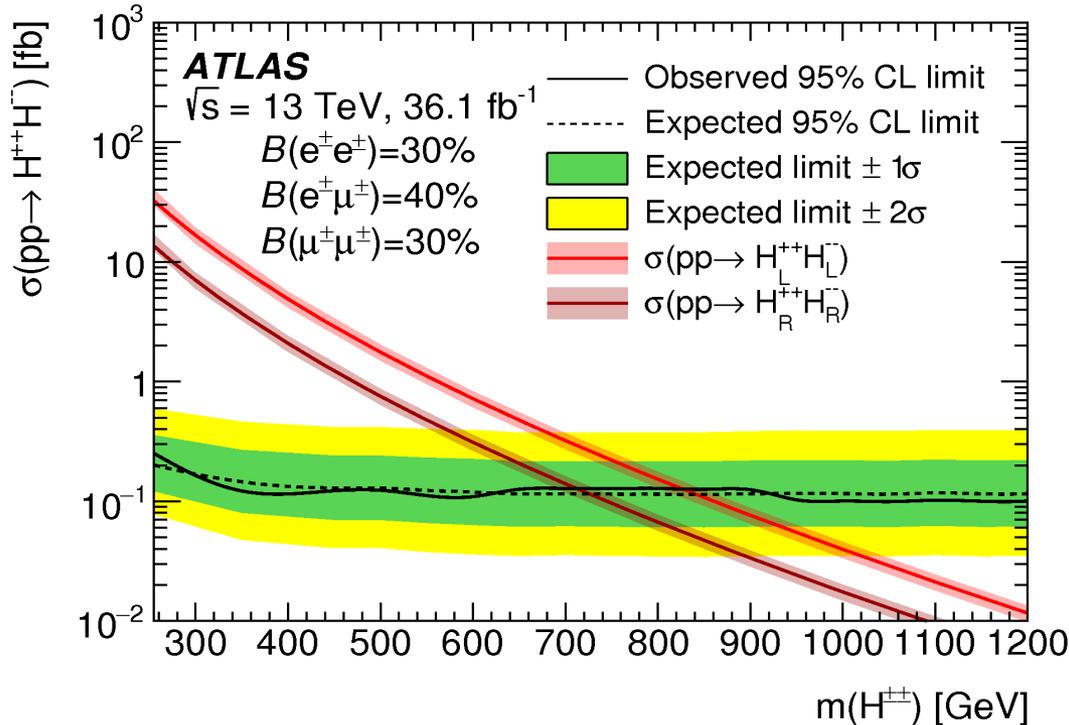

2-lepton and 3-lepton regions : mass of the same sign lepton pair

4-lepton region : average mass of two same-sign lepton pairs

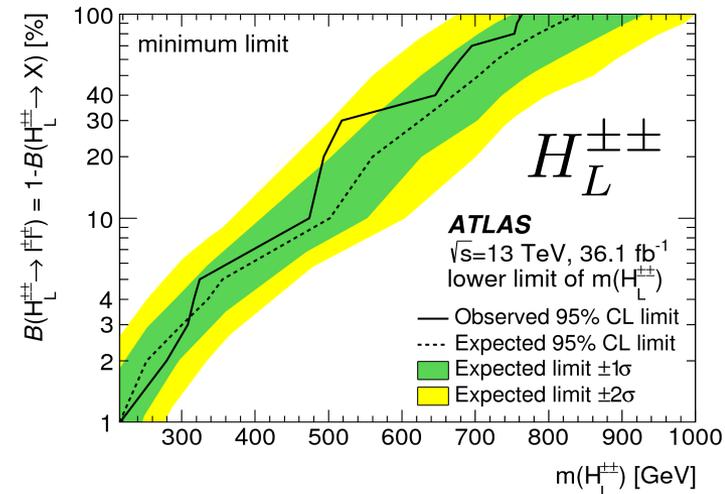

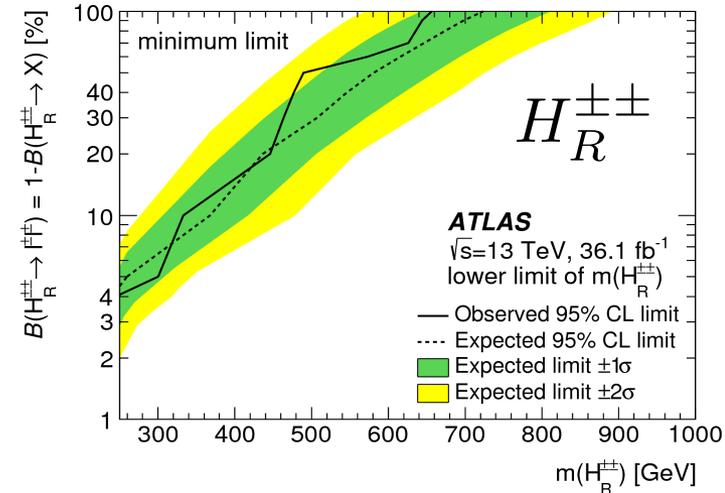

Interpretations of $H^{\pm\pm}$ Search

- no signal is observed in $H^{\pm\pm}$ search
- limit on $\text{BR}(H^{\pm\pm} \rightarrow \ell^\pm \ell^\pm)$ and $\sigma(pp \rightarrow H^{++}H^{--})$ are set under various model assumptions
- few representative examples are given here

least stringent limit on

$$B(H^{\pm\pm} \rightarrow \ell^\pm \ell^\pm) \equiv \sum_{\ell_i, \ell_j = e, \mu} B(H^{\pm\pm} \rightarrow \ell_i^\pm \ell_j^\pm)$$

Summary

- **Various searches are performed by ATLAS and CMS for exotic Higgs bosons beyond 2HDM and MSSM**
 - **generic 2HD+1S models**
 - **models with $H^{\pm\pm}$**
- **Searches reveal no signal so far**
- **Constraints are set on model parameters**
- **Collaborations are extending scope and enhancing sensitivity of these searches by**
 - **considering more experimental signatures**
 - **improving experimental techniques**

Backup

Summary of Run1 H(125) → aa Searches at CMS

- most of CMS H(125) → aa searches at CMS are performed inclusively

$$H(125) \rightarrow aa \rightarrow (\mu^+ \mu^-)(\mu^+ \mu^-)$$

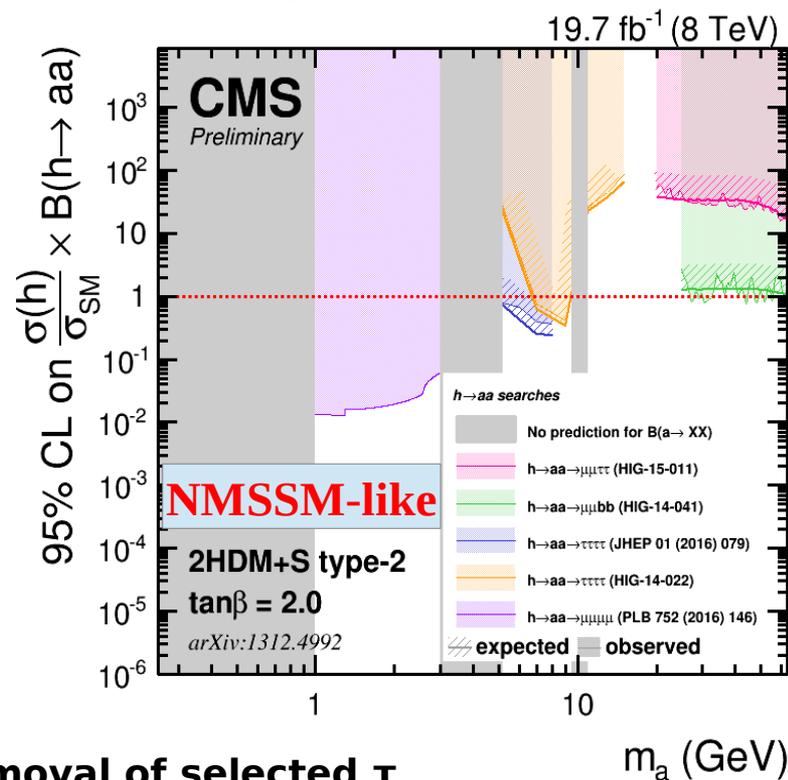

- clean signature : two boosted $\mu^+\mu^-$ pairs
- low background : mainly QCD multijets with muons from quarkonia and b/c-hadron decays (estimated from data)
- signal : resonant peak in 2D mass distribution of boosted muon pairs

$$H(125) \rightarrow a_1 a_1 \rightarrow (\tau_\mu^\pm \tau_{1\text{-prong}}^\mp)(\tau_\mu^\pm \tau_{1\text{-prong}}^\mp)$$

- signature : two same sign muons each accompanied by single track
- major background : QCD multijet (measured in data)
- signal extracted from 2D mass distribution of muon-track pairs

$$H(125) \rightarrow a_1 a_1 \rightarrow (\tau_\mu \tau_X)(\tau_\mu \tau_X)$$

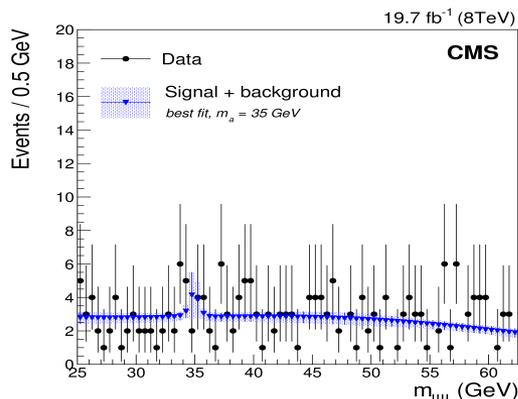

- sensitivity is enhanced by exploiting VH production mode in addition to $gg \rightarrow H$
- boosted τ pairs : τ_X identification after removal of selected τ_μ
- event categorization based on m_τ of triggering muon and missing E_τ
- counting experiment after mass cuts with $m_{\mu+X} > 4$ GeV

Summary of Run1 H(125) → aa Searches at CMS

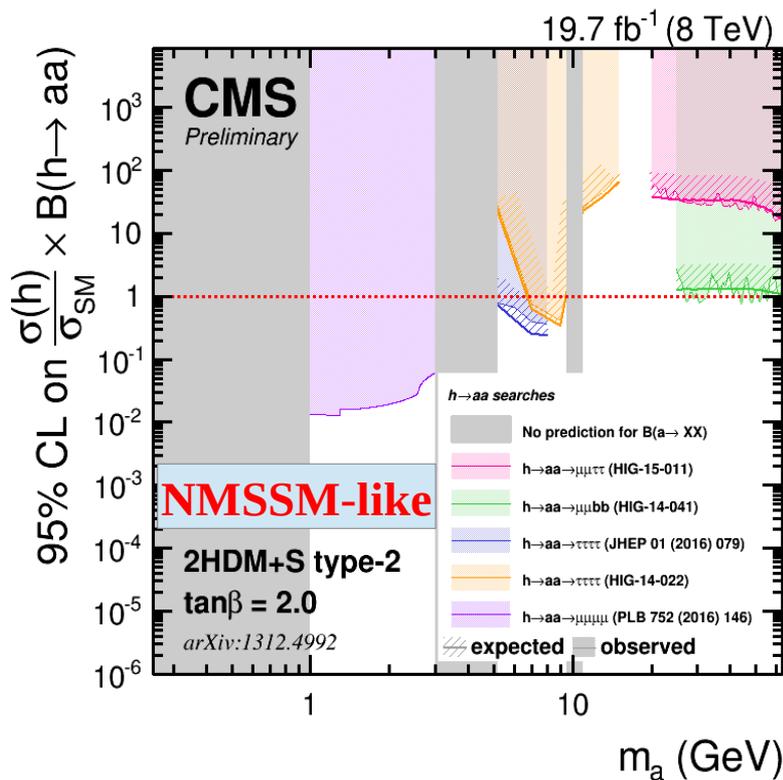

$$H(125) \rightarrow aa \rightarrow (\mu^+ \mu^-)(b\bar{b})$$

- **cut on invariant mass of selected objects : $|m_{bb\mu\mu} - 125 \text{ GeV}| < 25 \text{ GeV}$**
- **largest backgrounds : low mass Drell-Yan and top-pair events**
- **signal extracted from analytical fit of $m_{\mu\mu}$ spectrum**

$$H(125) \rightarrow aa \rightarrow (\mu\mu)(\tau\tau)$$

- **exploited di-tau signatures**
 $\mathcal{T}_e\mathcal{T}_e, \mathcal{T}_e\mathcal{T}_\mu, \mathcal{T}_e\mathcal{T}_h, \mathcal{T}_\mu\mathcal{T}_h, \mathcal{T}_h\mathcal{T}_h$
- **largest backgrounds : irreducible ZZ and WZ, WW and QCD with jet → τ fakes**
- **signal is extracted from analytical fit of $m_{\mu\mu}$ spectrum**

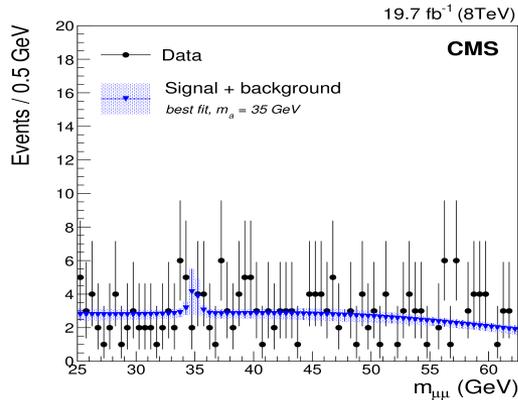

- **Both analyses are insensitive yet to NMSSM scenarios**

Summary of Run1 H(125) \rightarrow aa Searches at CMS

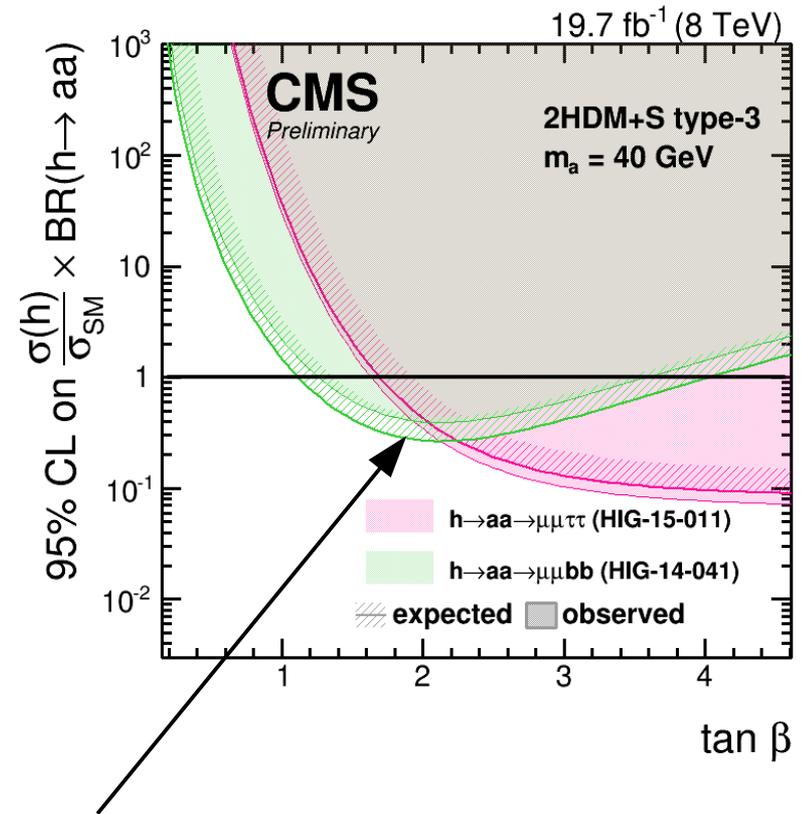

$$H(125) \rightarrow aa \rightarrow (\mu^+ \mu^-)(b\bar{b})$$

- **cut on invariant mass of selected objects : $|m_{bb\mu\mu} - 125 \text{ GeV}| < 25 \text{ GeV}$**
- **largest backgrounds : low mass Drell-Yan and top-pair events**
- **Signal extracted from analytical fit of $m_{\mu\mu}$ spectrum**

$$H(125) \rightarrow aa \rightarrow (\mu\mu)(\tau\tau)$$

- **Exploited di-tau signatures**
 $\mathcal{T}_e\mathcal{T}_e, \mathcal{T}_e\mathcal{T}_\mu, \mathcal{T}_e\mathcal{T}_h, \mathcal{T}_\mu\mathcal{T}_h, \mathcal{T}_h\mathcal{T}_h,$
- **Largest backgrounds : irreducible ZZ and WZ, WW and QCD with jet \rightarrow τ fakes**
- **Signal is extracted from analytical fit of $m_{\mu\mu}$ spectrum**

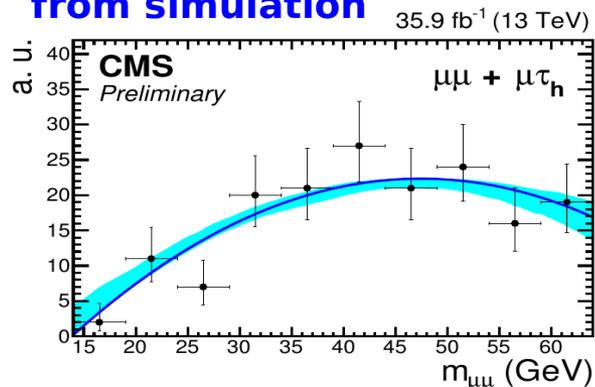

- **Both analyses are insensitive yet to NMSSM scenarios but provide constrains on alternative 2HD+1S models**

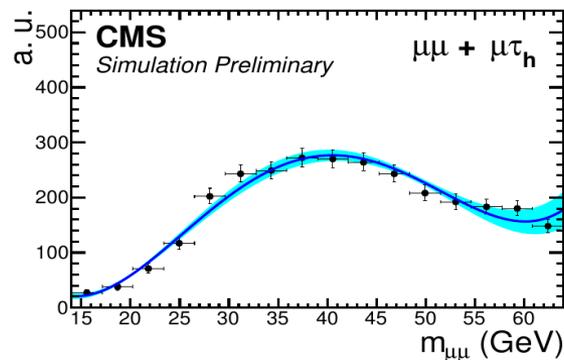

Signal extraction in $H(125) \rightarrow aa \rightarrow (\mu\mu)(\tau\tau)$ Search

Signal extracted from fit to mass spectrum of reconstructed $a \rightarrow \mu\mu$ candidate
background shape modeling : Bernstein polynomials

irreducible (ZZ) estimated from simulation

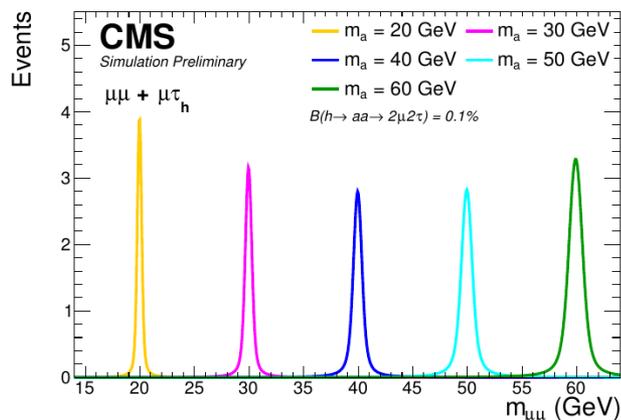

reducible (ZZ $\rightarrow 2\ell+2q$, $t\bar{t}$ bar, QCD) : from sideband with SS, loosely isolated τ candidates

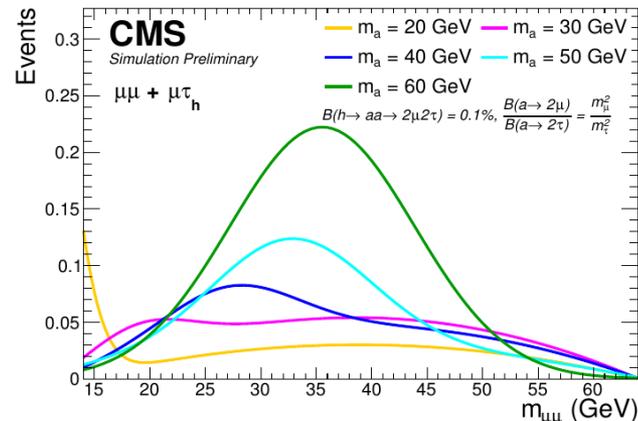

signal shape modeling

$H(125) \rightarrow aa \rightarrow (\mu\mu)(\tau\tau)$ component
 Voigtian = Gaussian \otimes Lorentz profile

$H(125) \rightarrow aa \rightarrow (\tau\tau)(\mu\mu)$ component
 Gaussian + polynomial

H(125) \rightarrow aa \rightarrow ($\mu\mu$)($\tau\tau$) Search with ATLAS at 8 TeV

Phys. Rev. D92 (2015) 052002

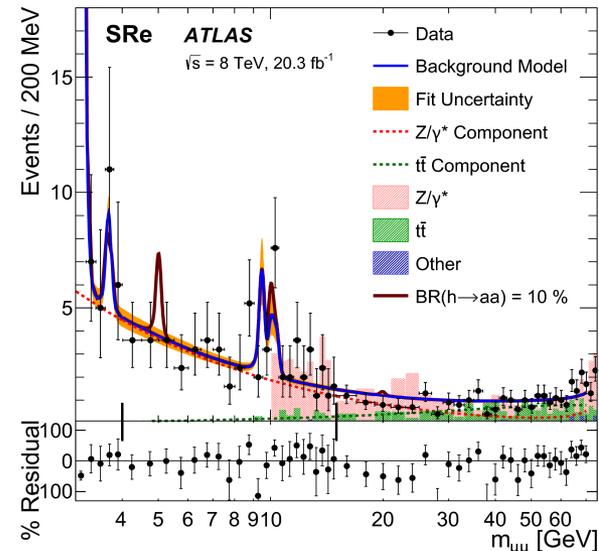

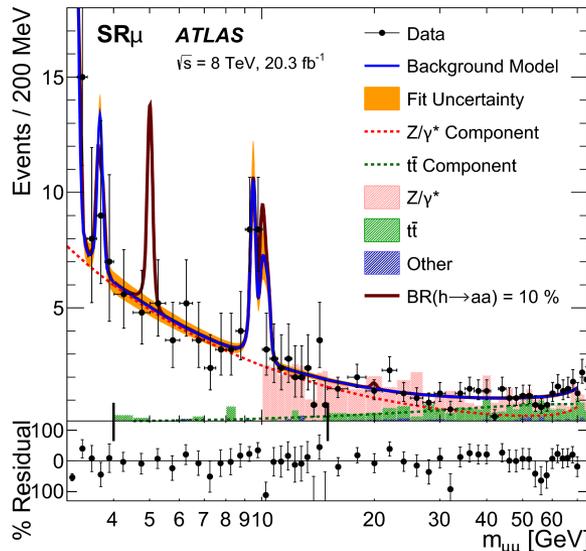

- search extends in m_a down to $a \rightarrow \tau\tau$ decay threshold ($m_a \sim 3.75$ GeV)

- $\mu^+\mu^-$ pairs with invariant mass in the range 2.8 - 70 GeV are selected
- one τ is identified via leptonic decay $\tau \rightarrow \ell\nu_\ell\nu_\tau$, $\ell = e, \mu$ (τ_ℓ)
- for low m_a a boson is Lorentz boosted & its decay products are collimated \rightarrow

τ_ℓ candidate is accompanied by 1, 2 or 3 nearby tracks with leading track having opposite sign w.r.t. τ_ℓ candidate

- two signal regions are defined by flavor of lepton from tau decay : SR μ & SR e

- signal is extracted from simultaneous fit of $m_{\mu\mu}$ spectrum of $a \rightarrow \mu\mu$ candidate in two signal regions

ATLAS H(125) \rightarrow aa \rightarrow ($\mu\mu$)($\tau\tau$) Search Results

- Results of the search are used to set limit on

$$\frac{\sigma(\text{gg} \rightarrow \text{h})}{\sigma_{\text{SM}}} \times \text{BR}(\text{h} \rightarrow \text{aa}) \times \text{BR}^2(\text{a} \rightarrow \tau\tau)$$

under assumption

$$\frac{\Gamma(\text{a} \rightarrow \mu\mu)}{\Gamma(\text{a} \rightarrow \tau\tau)} = \frac{m_\mu^2}{m_\tau^2 \sqrt{1 - (2m_\tau/m_a)^2}}$$
